What is cylinder deactivation, exactly? For the purposes of this article, cylinder deactivation refers to various strategies to deactivate some cylinders on V-type engines during light engine loads in attempts to meet ever-more stringent emissions regulations in some markets or jurisdictions, and most notably, in the state of California.

The Hit and Miss Nature of Cylinder Deactivation Systems

In a nutshell, cylinder deactivation is simply keeping the intake and exhaust valves closed through all cycles for a particular set of cylinders in the engine. Depending on the design of the engine, valve actuation is controlled by one of two common methods:

Cylinder Deactivation & Variable Engine Displacement

Deactivation is mostly used on V6 or V8 engines, where, in principle, it reduces the engine's displacement when it functions: Bigger-engine power when all cylinders are activated, and...

How It Works: Cylinder deactivation | Driving

Except for Honda's V-6 engine, most cylinder deactivation is applied to domestically-built truck V-8 engines, though various GM V-6 engines also are benefitting from the technology. Still, the systems don't get nearly as much attention as some other methods of boosting fuel economy. Start/Stop operation

Cylinder Deactivation: How It Can Save Fuel | Shopping ...

Cylinder Deactivation, or CDA, is a technique in multi-cylinder engines where a combination of cylinders are systematically disabled, effectively reducing the engine's displacement, improving overall engine efficiency and fuel economy. CDA is achieved by deactivating the intake and exhaust valves for the deactivated cylinder.

New Cylinder Deactivation System The base 5.3-liter V-8 uses an active fuel management system that deactivates cylinders to conserve fuel. It's similar to the setup in the 2018 Silverado and can either run the truck on four or eight cylinders. The new setup, also on the 6.2-liter V-8, uses what Chevy is calling Dynamic Fuel Management.

Chevrolet's New Cylinder Deactivation System Is a Game ...

Deactivating a single cylinder reduces engine torque generated, Other 3 injectors have to compensate for the torque loss, this affects Injector balance. It Does have an adverse effect on the engine life, in the following ways. An engine designed and balanced for 4 cylinders will have poor balancing with 3 cylinders.

Does cylinder deactivation affect engine life? - Quora

The new cylinder-deactivation system can be found in the latest SKYACTIV-G 2.5-liter engine that delivers 187 horsepower and 186 lb-ft of torque. Available on the 2018 Mazda CX-5 and 2018 Mazda6, Mazda is the only automaker to offer cylinder-deactivation technology on a four-cylinder engine in North America.

Mazda's New Cylinder-Deactivation Offers Improved Fuel ...

That's where cylinder deactivation comes in. Cylinder deactivation shuts down a number of the engine's cylinders when they're not needed. That means that when a car or truck is maintaining a constant speed and not accelerating, some cylinders aren't in use. Since they aren't in use, they aren't getting any gas either -- and that saves fuel ...

5 New Gas Engine Technologies | HowStuffWorks

Cylinder deactivation is used to reduce the fuel consumption and emissions of an internal combustion engine during light-load operation. In typical light-load driving the driver uses only around 30 percent of an engine's maximum power. In these conditions, the throttle valve is nearly closed, and the engine needs to work to draw air.

When cylinders are deactivated, the engine uses less fuel, but simply "turning off" the ignition source for the cylinders in question is only one of the operations that has to occur; the valves for...

What Is Hemi MDS?

When an engine fitted with cylinder deactivation detects the car is cruising, a solenoid valve opens and a system forces the valves shut, preventing fuel and air from reaching some of the cylinders. This means combustion is only taking place in half of the engine and thus much less fuel is burned when cruising.

What is cylinder deactivation? | carwow

Cylinder deactivation provides owners with the best of both worlds – V8 power when it's needed, and four-cylinder fuel economy and emissions levels when it's not. Typically, when a cylinder is deactivated, the system closes its intake and exhaust valves. It also stops injecting fuel into the deactivated cylinder.

Abstract: Cylinder deactivation (CDA) can be used to manage exhaust gas temperature in diesel engines. It allows to maintain the aftertreatment system temperature at idle and low load conditions without a fuel consumption penalty. When combined with other measures such as increased idle speed, it can also be used during warm-up.
